EXP.NO:06	ADT STACK APPLICATION
DATE:	
19.08.19	

### AIM:

To design a java program for ADT stack and to implement this interface using array by providing necessary handling in both the implementatin by pushing and poping string data

# **REQUIREMENT:**

- -knowledge of push and pop
- -Exception handling
- -Handling of array
- -Interface implementation

# **ALGORITHM:**

STEP 1: Start

STEP 2: create classes Mystack, Stack, Calculation and StackException

STEP 3: Define StackException with string in it

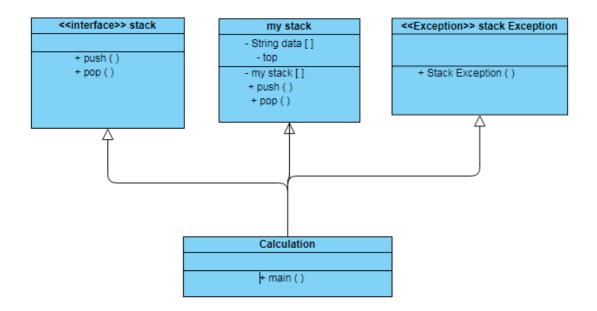

STEP 4: Define the interface by using throw exception

STEP 5:To add data define the data type i.e. string for describing different cases define the operation of each case to meet the requirement

STEP 6:Finish the coding with calculation class coding for the required output

STEP 7: Stop

## **CLASS DIAGRAM:**

### PROGRAM:

```
/*saveetha engineering college
* developed by
* suriya kumar
* 212217105057*/package mystack;
public interface Stack {
       public void push(String v) throws StackException;
       public String pop() throws StackException;
public class MyStack implements Stack {
       private String data[];
       private int top;
       public MyStack(int s)
              top=-1;
              data=new String[s];
       }
       @Override
       public void push(String v) throws StackException
              if(top>=(data.length-1))
                      throw new StackException("Stack Full: It is already having "+(top+1)+"
elements");
              top=top+1;
              data[top]=v;
       }
       @Override
       public String pop()throws StackException
              String result;
              if(top<0)
              {
                      throw new StackException("Stack is empty");
              result=data[top];
              top=top-1;
              return result;
       }
public class StackException extends Exception {
```

```
public StackException(String m)
               super(m);
import java.util.*;
public class Calculation {
       public static void main(String[] args) {
               String value1;
               int option;
               MyStack st;
               Scanner sc=new Scanner(System.in);
               st=new MyStack(5);
               while(true)
                      try
                      {
                              System.out.println("1. Push a string");
                              System.out.println("2. Pop a string");
                              System.out.println("3. Exit");
                              System.out.print("Enter your choice:");
                              option=sc.nextInt();
                              switch(option)
                              {
                              case 1:
                                     System.out.print("Enter a string:");
                                     value1=sc.next();
                                     st.push(value1);
                                     System.out.println("Push completed.");
                                     break:
                              case 2:
                                     value1=st.pop();
                                     System.out.printf("Stack top value=%s\n",value1);
                                     break;
                              default:
                                     System.out.print("Please enter a valid number !!!");
                              }
                              if(option==3)
                              {
                                     System.out.print("Thankyou for using stack application !!!");
                                     break;
                              }
                      }catch(StackException e1)
                              System.out.println("Error:"+e1.getMessage());
```

```
}catch(NumberFormatException e2)
                          System.out.println("Error:"+e2.getMessage());
                   }
             }
}
OUTPUT:
1. Push a string
2. Pop a string
3. Exit
Enter your choice:1
Enter a string: SURI
Push completed.
1. Push a string
2. Pop a string
3. Exit
Enter your choice:1
Enter a string:VOX
Push completed.
1. Push a string
2. Pop a string
3. Exit
Enter your choice:2
Stack top value=V0X
1. Push a string
2. Pop a string
3. Exit
Enter your choice:2
Stack top value=SURI
1. Push a string
2. Pop a string
3. Exit
Enter your choice:2
Error:Stack is empty
1. Push a string
2. Pop a string
3. Exit
Enter your choice:
```

#### **RESULT:**

Thus Java program for ADT stack and to implement this interface using array by providing necessary handling in both the implementatin by pushing and poping string data is done.
